

Type-Erased Audio Parameters

A New Approach to an Old Problem

Jan Wilczek (WolfSound)

ADC Japan 2026

A detailed pencil sketch of a hand holding an eraser, actively erasing the word "PARAMETER" written in large, bold, block letters. The eraser is positioned at the end of the word, and there are visible erasing marks and small debris around the letters. The word "PARAMETER" is written in a slightly curved, perspective-oriented manner. The background shows faint sketches of a pencil and a ruler, suggesting a drafting or design environment.

Who am I?

- Jan Wilczek [Yan Vil-check]
- Audio programming consultant & educator
- Founder of TheWolfSound.com blog & YouTube channel on audio programming
- WolfTalk podcast host
- Trainer
 - conference workshops
 - in-house training on DSP/JUCE
- Online course creator
 - DSP Pro on digital audio signal processing
 - Official JUCE C++ framework audio plugin development course (over 4,400 students enrolled)

Source: https://en.wikipedia.org/wiki/Japan-Poland_relations, accessed May 31, 2026.

Who here develops or uses audio plugins for digital audio workstations?

Who here uses JUCE to develop plugins?

Key terms

- **audio plugin**: a plugin for a digital audio workstation (DAW)
- **plugin processor**: the core of an audio plugin; responsible for plugin metadata, audio processing, and state management
- **plugin editor**: user interface (UI) of the plugin
- **plugin parameter**: a user-controllable value influencing audio processing of a plugin
 - `juce::AudioParameterFloat|Bool|Int|Choice` class instance in JUCE plugins
- **UI state**: non-audio-related state
- **serialization**: process of externalizing state (for example, to a JSON file)
- **deserialization**: process of loading state from an external source (for example, a JSON file)
- **preset** = plugin parameter values + metadata

Parameters in audio plugins

- Automation
- Serialization
- Presets (generic/custom)
- Visualization (generic/custom)
- UI (generic/custom)

Example of plugin parameters in action

Parameter class hierarchy in JUCE

JUCE parameter classes

- `AudioParameterBool`
 - `true / false`
- `AudioParameterInt`
 - integer in a closed range
 - e.g., "1" from
- `AudioParameterFloat`
 - real value from a closed range
 - e.g., "0.25" from 0, 2
- `AudioParameterChoice`
 - a value from a fixed set of named options
 - e.g., "lowpass" from

The Story of a Synth

Plugin processor

```
1  class EdenSynthAudioProcessor : public AudioProcessor {
2  public:
3      EdenSynthAudioProcessor();
4      ~EdenSynthAudioProcessor();
5
6      void prepareToPlay(double sampleRate, int samplesPerBlock) override;
7      void releaseResources() override;
8
9      #ifndef JUCEPlugin_PreferredChannelConfigurations
10         bool isBusesLayoutSupported(const BusesLayout& layouts) const override;
11     #endif
12
13     void processBlock(AudioBuffer<Float>&, MidiBuffer&) override;
14
15     AudioProcessorEditor* createEditor() override;
16     bool hasEditor() const override;
17
18     const String getName() const override;
19
20     bool acceptsMidi() const override;
21     bool producesMidi() const override;
22     bool isMidiEffect() const override;
23     double getTailLengthSeconds() const override;
24
25     int getNumPrograms() override;
26     int getCurrentProgram() override;
27     void setCurrentProgram(int index) override;
28     const String getProgramName(int index) override;
29     void changeProgramName(int index, const String& newName) override;
30
31     void getStateInformation(MemoryBlock& destData) override;
32     void setStateInformation(const void* data, int sizeInBytes) override;
33
34 private:
35     JUCE_DECLARE_NON_COPYABLE_WITH_LEAK_DETECTOR(EdenSynthAudioProcessor)
36
37     std::filesystem::path _assetsPath;
38     eden::EdenSynthesiser _edenSynthesiser;
39     eden_vst::EdenAdapter _edenAdapter;
40     AudioProcessorValueTreeState _pluginParameters;
41 };
```

Parameters via AudioProcessorValueTreeState

```
1  EdenSynthAudioProcessor::EdenSynthAudioProcessor()
2      : // ...
3      _pluginParameters{*this, nullptr} {
4      using Parameter = juce::AudioProcessorValueTreeState::Parameter;
5
6      _pluginParameters.createAndAddParameter(std::make_unique<Parameter>(
7          "pitchBend.semitonesDown", "Pitch bend semitones down",
8          NormalisableRange<float>(-24.f, 0.f, 1.f), -12.f));
9      _pluginParameters.createAndAddParameter(std::make_unique<Parameter>(
10         "pitchBend.semitonesUp", "Pitch bend semitones up",
11         NormalisableRange<float>(0.f, 24.f, 1.f), 2.f));
12      _pluginParameters.createAndAddParameter(std::make_unique<Parameter>(
13         "frequencyOfA4", "Frequency of A4",
14         NormalisableRange<float>(400.f, 500.f, 0.1f), 440.f,
15         AudioProcessorValueTreeStateParameterAttributes{}.withLabel("Hz")));
16      // more parameters ...
17
18      _pluginParameters.state = ValueTree(Identifier("EdenSynthParameters"));
19  }
```

Parameters via AudioProcessorValueTreeState

New API

```
1  EdenSynthAudioProcessor::EdenSynthAudioProcessor()
2      : // ...
3      _pluginParameters{*this, nullptr, "EdenSynthParameters", {
4          std::make_unique<AudioParameterFloat>(
5              "pitchBend.semitonesDown", "Pitch bend semitones down",
6              NormalisableRange<float>(-24.f, 0.f, 1.f), -12.f),
7          std::make_unique<AudioParameterFloat>(
8              "pitchBend.semitonesUp", "Pitch bend semitones up",
9              NormalisableRange<float>(0.f, 24.f, 1.f), 2.f),
10         std::make_unique<AudioParameterFloat>(
11             "frequencyOfA4", "Frequency of A4",
12             NormalisableRange<float>(400.f, 500.f, 0.1f), 440.f,
13             AudioProcessorValueTreeStateParameterAttributes{}.withLabel("Hz")),
14         // more parameters ...
15     }} {}
```

Parameters via AudioProcessorValueTreeState

Usage in audio processing

```
1 void EdenSynthAudioProcessor::processBlock(AudioBuffer<float>& buffer,  
2                                           MidiBuffer& midiMessages) {  
3     // ...  
4  
5     _synthesiser.setPitchBendRange(  
6         {static_cast<int>(  
7             *pluginParameters.getRawParameterValue("pitchBend.semitonesDown")),  
8             static_cast<int>(  
9                 *pluginParameters.getRawParameterValue("pitchBend.semitonesUp"))});  
10    _synthesiser.setFrequencyOfA4(  
11        *pluginParameters.getRawParameterValue("frequencyOfA4"));  
12  
13    // audio & MIDI processing  
14 }
```

Parameters via AudioProcessorValueTreeState

Serialization

```
1 void EdenSynthAudioProcessor::getStateInformation(MemoryBlock& destData) {  
2     auto state = _pluginParameters.copyState();  
3     const std::unique_ptr<XmlElement> xml(state.createXml());  
4     copyXmlToBinary(*xml, destData);  
5 }
```

Parameters via AudioProcessorValueTreeState

Deserialization

```
1 void EdenSynthAudioProcessor::setStateInformation(const void* data,
2                                                    int sizeInBytes) {
3     std::unique_ptr<XmlElement> xmlState(getXmlFromBinary(data, sizeInBytes));
4
5     if (xmlState.get()) {
6         if (xmlState->hasTagName(_pluginParameters.state.getType())) {
7             _pluginParameters.replaceState(ValueTree::fromXml(*xmlState));
8         }
9     }
10 }
```

Parameters via AudioProcessorValueTreeState

Usage in the plugin editor

```
1  class GeneralSettingsComponent : public Component {
2  public:
3      using SliderAttachment = AudioProcessorValueTreeState::SliderAttachment;
4
5      GeneralSettingsComponent(AudioProcessorValueTreeState&);
6
7      void resized() override;
8      void paint(Graphics& g) override;
9
10 private:
11     Slider _pitchBendSemitonesUp;
12     std::unique_ptr<SliderAttachment> _pitchBendSemitonesUpAttachment;
13
14     Slider _pitchBendSemitonesDown;
15     std::unique_ptr<SliderAttachment> _pitchBendSemitonesDownAttachment;
16
17     Slider _a4Frequency;
18     std::unique_ptr<SliderAttachment> _a4FrequencyAttachment;
19 };
```

Parameters via AudioProcessorValueTreeState

Usage in the plugin editor

```
1  GeneralSettingsComponent::GeneralSettingsComponent(  
2      AudioProcessorValueTreeState& valueTreeState)  
3      : _pitchBendSemitonesUp{/* */},  
4        _pitchBendSemitonesDown{/* */},  
5        _a4Frequency{/* */} {  
6      addAndMakeVisible(_pitchBendSemitonesUp);  
7      _pitchBendSemitonesUpAttachment = std::make_unique<SliderAttachment>(  
8          valueTreeState, "pitchBend.semitonesUp", _pitchBendSemitonesUp);  
9  
10     addAndMakeVisible(_pitchBendSemitonesDown);  
11     _pitchBendSemitonesDownAttachment = std::make_unique<SliderAttachment>(  
12         valueTreeState, "pitchBend.semitonesDown", _pitchBendSemitonesDown);  
13  
14     addAndMakeVisible(_a4Frequency);  
15     _a4FrequencyAttachment = std::make_unique<SliderAttachment>(  
16         valueTreeState, "frequencyOfA4", _a4Frequency);  
17 }
```

How to add presets? 🤔

Reuse `get/setStateInformation()`

```
1 void savePreset(const std::string& presetName) {  
2     juce::MemoryBlock presetData;  
3     pluginProcessor.getStateInformation(result);  
4     const auto presetFile = juce::File{presetPathFromName(name)};  
5     presetFile.deleteFile();  
6     presetFile.appendData(presetData.getData(), presetData.getSize());  
7 }
```

Reuse `get/setStateInformation()`

```
1 void loadPreset(const std::string& presetName) {
2     const auto presetFile = juce::File{presetPathFromName(name)};
3
4     juce::MemoryBlock presetData;
5     const auto result = presetFile.loadFileAsData(presetData);
6
7     if (!result) {
8         return;
9     }
10
11     pluginProcessor.setStateInformation(presetData.getData(),
12                                       static_cast<int>(presetData.getSize()));
13 }
```

Preset structure when using APVTS

```
1  <?xml version="1.0" encoding="UTF-8"?>
2
3  <EdenSynthParameters>
4      <PARAM id="envelope.adbdr.attack.curve" value="1.0" />
5      <PARAM id="envelope.adbdr.attack.time" value="30.0" />
6      <PARAM id="envelope.adbdr.breakLevel" value="0.6000000238418579" />
7      <PARAM id="envelope.adbdr.decay1.curve" value="1.0" />
8      <PARAM id="envelope.adbdr.decay1.time" value="20.0" />
9      <PARAM id="envelope.adbdr.decay2.curve" value="1.0" />
10     <PARAM id="envelope.adbdr.decay2.time" value="20000.0" />
11     <PARAM id="envelope.adbdr.release.curve" value="1.0" />
12     <PARAM id="envelope.adbdr.release.time" value="300.0" />
13     <PARAM id="filter.contourAmount" value="1.0" />
14     <PARAM id="filter.cutoff" value="1.0" />
15     <PARAM id="filter.passbandAttenuation" value="0.0" />
16     <PARAM id="filter.resonance" value="0.0" />
17     <PARAM id="frequencyOfA4" value="440.0" />
18     <!-- more parameters ... -->
19     <PARAM id="output.volume" value="1.0" />
20     <PARAM id="pitchBend.semitonesDown" value="-12.0" />
21     <PARAM id="pitchBend.semitonesUp" value="2.0" />
22     <PARAM id="waveshaper.autoMakeUpGain" value="0.0" />
23 </EdenSynthParameters>
```

APVTS-based parameters

Pros

- Easy to implement
- Automatic serialization of all parameters for free
- Can work (somewhat) for presets
- Easy UI attachments

Cons

- Parameters mangled with UI state
- Little control over XML structure in serialization
- Values as `float s` (no meaningful values or types)
 - `processBlock()`
 - presets
- What if I want a different serialization format, like JSON?
- Other APVTS drawbacks, e.g., requires a message thread

What we did in the official JUCE course

"References only"

Parameters via references only

```
1  class PluginProcessor : public juce::AudioProcessor {
2  public:
3      PluginProcessor();
4      // ...

15
16         std::string pluginName = TREMOLO_PLUGIN_NAME;
17
18         archive(named("pluginName", pluginName));
19
20         if (pluginName != TREMOLO_PLUGIN_NAME) {
21             return;
22         }
23
24         archive(named("modulationRateHz", p.rate), named("bypassed", p.bypassed),
25                 named("modulationWaveform", p.waveform));
26     }
27 };
```

```

1  SerializableParameters from(const :Parameters& p) {
2      return {
3          .rate = p.rate.get(),
4          .bypassed = p.bypassed.get(),
5          .waveform = p.waveform.getCurrentChoiceName(),
6      };
7  }
8
9  void JsonSerializer::serialize(const Parameters& parameters,
10                               juce::OutputStream& output) {
11      const auto json = juce::ToVar::convert(from(parameters));
12
13      if (!json.has_value()) {
14          return;
15      }
16
17      juce::JSON::writeToStream(output, *json,
18                               juce::JSON::FormatOptions{}
19                               .withSpacing(juce::JSON::Spacing::multiLine)
20                               .withMaxDecimalPlaces(2));
21  }

```

Concrete-type based parameters

Pros

- Full type safety
- Easy access to singular parameters
 - `processBlock()`
- We can use any serialization format we like
- Serialization code can be reused for presets
- Easy UI attachments
- Possibility to add UI state serialization

Cons

- "Manual" serialization code
 - Adding new parameters requires updating `JsonSerializer` $\implies$ error-prone

Summary so far

1. We can treat plugin parameters as a collection of `juce::RangedAudioParameter` s (just like `juce::AudioProcessorValueTreeState`) $\implies$ We lose type information
2. We can treat plugin parameters individually using only concrete `juce::AudioParameterFloat|Bool|Int|Choice` classes $\implies$ We cannot (easily) define operations on a collection of parameters

Summary so far

1. Parameter collection: extensibility
2. Individual parameters: interpretability

How can we treat parameters as a collection without losing type information? 🤔

Answer: Type Erasure!

Type-Erased Parameters

Collection of parameters

```
1  class TypeErasedParameter;  
2  
3  std::vector<TypeErasedParameter> parameters;
```

TypeErasedParameter

```
1  class TypeErasedParameter {
2  public:
3      template <class Parameter>
4      TypeErasedParameter(Parameter& p) : _impl{std::make_unique<ParameterModel<Parameter>>(p)} {}
5
6  private:
7      class ParameterConcept {
8      public:
9          virtual ~ParameterConcept() = default;
10     };
11
12     template <class Parameter>
13     class ParameterModel : public ParameterConcept {

39
40         std::vector<TypeErasedParameter> _parameters;
41     };
```

Usage

```
1  class PluginProcessor : public juce::AudioProcessor {
2  public:
3      explicit PluginProcessor(
4          ParameterHolder::Builder builder = {})
5          : floatParam{builder.add<juce::AudioParameterFloat>(
6              "floatParam", "Float Param", juce::NormalisableRange{1.f, 10.f}, 5.f)},
7            boolParam{builder.add<juce::AudioParameterBool>(
8              "boolParam", "Bool Param", true)},
9            intParam{builder.add<juce::AudioParameterInt>(
10              "intParam", "Int Param", 5, 10, 6)},
11            choiceParam{builder.add<juce::AudioParameterChoice>(
12              "choiceParam", "Choice Param", juce::StringArray{"choice 0", "choice 1", "choice 2"}, 1)},
13            parameterHolder{std::move(builder).build(*this)} {}
14
15      // ...
16  private:
17      juce::AudioParameterFloat& floatParam;
18      juce::AudioParameterBool& boolParam;
19      juce::AudioParameterInt& intParam;
20      juce::AudioParameterChoice& choiceParam;
21      ParameterHolder parameterHolder;
22  };
```

Serialization using a Visitor

```
1  struct ParameterIdAndValue {
2      std::string id;
3      std::variant<float, int, bool, std::string> value;
4  };
5
6  class ParameterValuesExtractor : public Visitor {
7  public:
8      ParameterValuesExtractor() = default;
9      void visit(juce::AudioParameterFloat& parameter) override { visitImpl(parameter, parameter.get()); }
10     void visit(juce::AudioParameterBool& parameter) override { visitImpl(parameter, parameter.get()); }
11     void visit(juce::AudioParameterInt& parameter) override { visitImpl(parameter, parameter.get()); }
12     void visit(juce::AudioParameterChoice& parameter) override {
13         visitImpl(parameter, parameter.getCurrentChoiceName().toStdString());
14     }
15     [[nodiscard]] std::vector<ParameterIdAndValue> result() const { return _result; }
16 private:
17     template <class P, class V>
18     void visitImpl(const P& parameter, V&& value) {
19         _result.emplace_back(parameter.getParameterID().toStdString(), std::forward<V>(value));
20     }
21
22     std::vector<ParameterIdAndValue> _result;
23 };
```

Serialization using a Visitor

```
1  std::vector<ParameterIdAndValue> parameterIdsAndValues(ParameterHolder& ph) {  
2      ParameterValuesExtractor visitor;  
3      ph.accept(visitor);  
4      return visitor.result();  
5  }
```

What if we want to support custom parameter classes?

⇒ make `ParameterHolder` templated on the `Visitor` class.

What if we want to support custom parameter classes?

```
1  template <class Visitor>
2  class ParameterHolder {
3      // ...
4  public:
5      void accept(Visitor& v) { /* ... */ }
6      // ...
7  };
```

What if we want to support custom parameter classes?

A good default

```
1  struct JuceParameterVisitor {
2      virtual ~JuceParameterVisitor() = default;
3      virtual void visit(juce::AudioParameterBool&) = 0;
4      virtual void visit(juce::AudioParameterFloat&) = 0;
5      virtual void visit(juce::AudioParameterInt&) = 0;
6      virtual void visit(juce::AudioParameterChoice&) = 0;
7  };
8
9  using JuceParameterHolder = ParameterHolder<JuceParameterVisitor>;
```

Summary

1. General: Use the Type Erasure design pattern together with the Visitor design pattern to manage collections of strongly typed objects of different classes
2. Specific: Use Type Erasure to perform operations on all parameter objects of your plugin without losing their type
 - Keep references to concrete parameter objects to access them individually
3. Try out/tweak `wolfound::ParameterHolder` from github.com/JanWilczek/wolfound-dsp-utils
